Strategies to Improve Cardiac Arrest Survival Institute of Medicine,Board on Health Sciences Policy,Committee on the Treatment of Cardiac Arrest: Current Status and Future Directions,2015-09-29 Cardiac arrest can strike a seemingly healthy individual of any age, race, ethnicity, or gender at any time in any location, often without warning. Cardiac arrest is the third leading cause of death in the United States, following cancer and heart disease. Four out of five cardiac arrests occur in the home, and more than 90 percent of individuals with cardiac arrest die before reaching the hospital. First and foremost, cardiac arrest treatment is a community issue - local resources and personnel must provide appropriate, high-quality care to save the life of a community member. Time between onset of arrest and provision of care is fundamental, and shortening this time is one of the best ways to reduce the risk of death and disability from cardiac arrest. Specific actions can be implemented now to decrease this time, and recent advances in science could lead to new discoveries in the causes of, and treatments for, cardiac arrest. However, specific barriers must first be addressed. Strategies to Improve Cardiac Arrest Survival examines the complete system of response to cardiac arrest in the United States and identifies opportunities within existing and new treatments, strategies, and research that promise to improve the survival and recovery of patients. The recommendations of Strategies to Improve Cardiac Arrest Survival provide high-priority actions to advance the field as a whole. This report will help citizens, government agencies, and private industry to improve health outcomes from sudden cardiac arrest across the United States.

Sudden Cardiac Death Peter Magnusson, Jo Ann LeQuang, 2020-11-19 Sudden cardiac death is a global health threat for which we have only partial answers. With growing elucidation of the underlying pathophysiological mechanisms of sudden cardiac death, better patient identification and treatment options are being developed. These include risk stratification

paradigms, ICD therapy, pharmacological options, ablative procedures, and other treatments. This book covers many of these options, including defibrillator technology and clinical applications. It also examines pathophysiological pathways and etiologies as well as highlights risk-stratification in ion channel diseases and structural heart disease such as dilated cardiomyopathy.

Forensic Pathology of Infancy and Childhood Kim A. Collins, Roger W. Byard, 2014-02-18 The investigation of sudden or unexplained death of children represents a unique medical and forensic area of study. Children have unique anatomic and functional characteristics that must be recognized and understood by the medical investigator. Further complicating this process is the fact that the anatomic structure, composition and function of various organs and organ systems in the pediatric population change throughout the developmental stages of childhood. The disease processes, reactions to trauma and risk factors for accidental death and homicide change from infancy through adolescence. Forensic Pathology of Infancy and Childhood provides an authoritative, comprehensive reference text devoted to the medicolegal investigation of sudden unexpected death in children. With contributions from internationally renowned experts, individual chapters focus on specific unique causes and organ systems with detailed accounts of the changes in fatal diseases, risk factors of causes of sudden

death, and responses to fatal trauma that occur as a child grows from neonatal stage through infancy, toddlerhood, childhood and adolescence. This text is an essential reference resource for forensic pathologists, medical examiner offices, pediatric pathologists, pediatric hospitals, anatomic pathologists and those in training as well as those in related legal professions.
