Apr 08, 2019 - Why is this important? First, because stationary processes are easier to analyze. Without a formal definition for processes generating time series data (yet; they are called stochastic processes and we will get to them in a moment), it is already clear that stationary processes are a sub-class of a wider family of possible models of reality.

A stochastic simulation is a simulation of a system that has variables that can change stochastically (randomly) with individual probabilities. Realizations of these random variables are generated and inserted into a model of the system. Outputs of the model are recorded, and then the process is repeated with a new set of random values. These steps are repeated until a ...
