The Western Aphasia Aphasia is an acquired disorder caused by an injury to the brain and affects a person's ability to communicate. It is most often the result of stroke or head injury. An individual with aphasia may experience difficulty expressing themselves when speaking, difficulty understanding the speech of others, and difficulty reading and writing.An RCT indicated that daily aphasia therapy in very early stroke recovery (starting at 3 days) improved communication outcomes in people with moderate to severe aphasia. 496 One systematic review of treatment in patients at >6 months after stroke concluded that aphasia therapy continued to be efficacious in the chronic stages, 497 whereas The Western Aphasia Battery-Revised (WAB-R) assesses linguistic skills most frequently affected by aphasia, plus key nonlinguistic skills, and provides differential diagnosis information. Adaptable to various administration settings from hospital room to clinic, it provides a baseline level of performance to measure change over time.Aphasia sample (CLQT+): one clinical study including 76 individuals diagnosed with aphasia associated with left hemisphere strokes were given the revised version of the CLQT.
