**List of Aquatic Mammals | Pets on Mom.com**

Mammals are vertebrate animals that are endothermic, have hair on their bodies, and produce milk to feed their babies. Many mammals give birth to live young that are small and helpless. Producing milk to feed them allows them to develop more slowly and spend time with the adults as they grow up, learning the skills they need to survive.
The historic range of the mountain lion included almost all of North and South America. The species was so wide-reaching and populous that it had multiple subspecies that varied based on location. Throughout the 1800s and early 1900s, people feared the mountain lion because it posed a risk to their livestock.

The black-footed ferret, North America’s rarest mammal, is returning to the western prairie 35 years after being declared extinct. The comeback trail for Mustela nigripes began in 1981, when a few of the species were relocated to a captured population in captivity.

Humans had wiped out most large mammals in the Americas shortly after their arrival around 10 to 15,000 years ago. 83% of North, and 72% of South America’s megafauna (mammals weighing more than 40 kilograms) went extinct. Today, they are home to much fewer large mammal species. North America has none that are threatened with extinction.
